SZABIST University
SZABIST (Islamabad Campus), Pakistan

Fall 2026

Purpose

Businesses and researchers need reliable findings without spending so much time gathering and checking the same information. The proposed system brings research work together to reduce repetitive tasks and help teams assess their evidence. Its purpose is to make market research easier to manage and business decisions easier to justify.

Introduction

Market research teams often work with survey files, field records and online sources that sit in separate places. Researchers spend time matching and checking these records before analysis can begin. The proposed system uses cooperating AI agents to reduce this manual work and help teams explain the evidence behind their findings.

Targeted Audience

The main users are market researchers, data analysts and business strategists who compare customer feedback and campaign results. These users need a clear link between findings and evidence. Business owners and company managers form the secondary audience, particularly when they conduct research without a dedicated analysis team.

Product Functions and Features

The system uses AI agents to plan research, collect web information and extract relevant details. Researchers examine survey responses alongside secondary sources. The system cleans data and compares sources to identify gaps or conflicting information for review. Users compare competitors and results across different periods to understand market changes. Interactive dashboards present these comparisons, and users adjust the views through natural language commands. Users ask the conversational assistant questions about the research data and receive answers with links to supporting evidence. Human reviewers assess uncertain records before those records enter the analysis.

Social and Industrial Impact

For research teams, the main gain will be time. They will no longer match records manually. Their effort will instead go into interpreting findings. Smaller businesses and independent researchers will use analysis tools without hiring a large team. Consumers will give feedback through online questionnaires or field interviews. The interviews will reach places with limited internet access.

Companies will turn the findings into campaign plans and decide where to put their research budgets. Researchers will back up their conclusions with supporting records. This will let others check the work and make research more accountable.

Final Year Project (Bachelor of Computer Science)

Supervisor Consent Form

I accept the supervision of the following students with details as follows

Project Title:	Multi-Agent Market Research Platform
Student#1 Name & Registration Number	Aroon Kumar (2312466)
Student#2 Name & Registration Number	Mudasir Ali (2312465)
Student#3 Name & Registration Number	Abdullah Zafar Khan (2312467)

Supervised By: Mr. Zubair Ahmed
